Description

Description

This is a highly variable species. Typically it has sharp, triangular leaves, mottled in colour and channeled on their upper surface. The leaves have sharp points at their tips, and usually have keels in mature plants. The tiny spots on the leaves are arranged in bands, giving the leaves faint stripes (similar to *Gasteria batesiana*).

It is prolific and can form dense clumps.

Distribution

The natural range of this species is the southern stretch of the Western Cape Province, South Africa. Here it occurs in rocky areas in Renosterveld and Fynbos vegetation, between Hermanus and Mossel Bay.

Its closest relative is the enormous "Dune Gasteria (*Gasteria acinacifolia*) to the east.
