Description

Description

The genus can be distinguished with certainty though, by its seed capsules. As with most Aizoaceae, these are hygrochastic, with triangular valves that open and close with changes in humidity. The seed capsule valves of *Ruschia* have a little closing body to pull them closed when they dry again, and two keels on either side of the closing body, which expand and push open the valve. There is a covering membrane too, which partially covers the seeds, to prevent them all being washed away immediately.

Vygies: *Ruschia robusta* (*Ruschia robusta*)
