Description

Description

African Aloe: Somalian dwarf aloe (*Aloe jucunda*)

Aloe jucunda can reach a height of about 35 cm. It has shiny, glossy, triangular, dark green leaves, usually about twelve, flecked with pale green spots, up to 4 cm long and 2–5 cm wide, with triangular teeth on the margins.

The inflorescences are single cylindrical clusters, about 35 cm high. The flowers are pale pink or coral pink, 20–30 mm.

Distribution and habitat

This species is native to northern Somalia. *A. jucunda* occurs only in dry forests on limestone at altitudes from 1060 to 1680 meters, within a very restricted range about 30 km across on the Gaan Libah plateau.

Conservation

Due to its narrow range, occurrence in only three locations, and the continuing degradation of its habitat, *A. jucunda* is currently classified as critically endangered by the [IUCN](#).
