Description

Searsia lancea commonly known as **karee, karree** (Afrikaans), is an evergreen, frost hardy, drought resistant tree, which can reach up to 8 metres in height with a 5 metre spread. In North America, where it is naturalized, it is known as **African sumac** and **willow rhus**. It is one of the most common trees on the Highveld and in the Bushveld in South Africa, but not found in the Lowveld.

Description and uses

Trees: Karee (*Searsia (rhus) lancea*)

The tree has a graceful, weeping form and dark, fissured bark that contrasts well with its long, thinnish, hairless, dark-green, trifoliate leaves with smooth margins. It bears small yellow flowers followed on female trees by bunches of small yellow-green flattish fruits, which are relished by birds. In earlier times the fruits were pounded, water added and left to ferment, producing an evidently refreshing beer. The tree is a good shade tree for gardens, parks and pavements. It favours areas rich in lime in the Karoo and Namibia.
